

## *The science behind Pixel Perfect*

---

Pixel Perfect, the aesthetic procedure performed by the Pixel laser system from Alma Lasers, stimulates new collagen growth to improve your skin's texture and tone and fight fine lines and wrinkles.

Pixel Perfect works by creating thousands of microscopic perforations, but the skin around each of these perforations remains intact. This allows your skin's top layer to heal from the edge of these tiny holes very rapidly.

Not only is healing time shortened considerably, but Pixel Perfect also comes with a lower risk of complications, as compared to traditional laser skin resurfacing.

## *Dramatically revitalized results*

---

You'll see dramatic improvement in the tone and texture of your skin. Many patients choose Pixel Perfect because it:

- Clears sun-damaged skin
- Smooths fine lines and wrinkles
- Shrinks the appearance of pores
- Fills in acne scars
- Blends uneven pigmentation

## *Safe and comfortable*

---

Pixel Perfect treatments are safe and effective, without injections or surgery. You can expect your skin to be flushed and red after the treatment—something similar to a sunburn. Your doctor may also prescribe an over-the-counter pain medicine to make you more comfortable. These symptoms are a normal part of the healing process and should improve within approximately three days.

## *Reverse the early signs of ageing*

---

*Pixel Perfect* is an aesthetic laser treatment that lifts away years from your face. It can help reverse the early signs of ageing, and helps counteract years of sun damage or acne scarring. It provides noticeable results, often in as little as a single treatment.

## *Proven effectiveness*

---

If you've considered traditional (ablative) laser skin resurfacing, dermabrasions or deep chemical peels—but were put off by the extended recovery time or anaesthesia required—Pixel Perfect offers a great balance. It can provide the dramatic results of these procedures, but with fewer risks. Plus, it reduces necessary healing time from up to thirty days to usually three, making it the ideal “weekend” procedure.
